INT-CL (IPC): B30B 15/02

ABSTRACTED-PUB-NO: SU 676472A

BASIC-ABSTRACT:

The press comprises a die on the press table, a plunger on the moving crosspiece of the press, and also a chamber linked to a vacuum pump. In order to increase productivity, the chamber is made as a sleeve concentric with the plunger and spring-loaded relative to the cross-piece, while also having at least three radial holes, the one connected to the atmos. and the others to the vacuum pump of the pellets flows into a cavity in the sleeve, and it is finally drawn out by the pump which starts to operate once the crosspiece ascends at the end of the pressing operation.

The system eliminates the need for frequent cleaning of the press table and the tool, and the consequent absence of explosive hazard enables the pellets to be pressed into a blank hole in the part thus also increasing output.
